

Patient Enrollment

CASE STUDY

A decentralized trial provider that was struggling with patient enrollment for over 18 months was able to increase enrollment by 3x's within a 3 month period after implementing BEKHealth

Clinical Research Solutions

“BEKHealth increased our revenue by over 400%”

The Problem

A decentralized trial provider was running a depression study for 18 months at 59 locations with a total enrollment of 8 patients out of a required 120 available. This was an enrollment rate of <0.01 patients per site per month causing the study to be at risk of shut down due to lack of patients.

Our Approach

We connected the BEKHealth Network to our decentralized trial provider and the protocol was live on the research site in less than 2 weeks. The first patient list delivered identified over 60 patients meeting 90% of the trial protocol criteria resulting in 3x's more patients enrolled and 50x better enrollment rate compared to any other trial site.

Our Results

3x

More Patient Enrollment

In the first 3 months the BEKHealth supported study site enrolled 3x's more patients into the study resulting in an enrollment rate 50x higher than any other site running

20%

Lower Screen Fail Rate

The BEKHealth supported site had a 20% overall lower Screen Fail Rate

400%

Increased Revenue

The BEKHealth supported study site was able to increase revenue by over 400% by identifying more patients in less time
